Macie

Amazon Macie is a security service that uses machine learning and pattern matching to discover, classify, and protect sensitive data stored in AWS. It automatically identifies and alerts you to sensitive data such as personally identifiable information (PII), helping you meet compliance requirements and reduce the risk of data breaches.

It continuously monitors our Amazon S3 buckets for anomalies and unauthorized access, providing detailed dashboards and alerts to help you quickly respond to potential security threats. By enhancing visibility into the security of our data, Macie plays a crucial role in maintaining the privacy and integrity of sensitive information.

TLDR;

Amazon Macie is used to detect **PII** (Personally identifiable information).
